INTRODUCTION

- Importance of bus transportation in public transport
- Shortcomings of bus transportation
- Reasons for the shortcomings
- Solution: Dynamic scheduling

PROBLEM STATEMENT

- Public transit - a mix of private business and government
- Current BEST bus services are static
- Inefficient as well as underutilization of resources

EXISTING SOLUTION

- Human schedulers.
- Demographics of regions(residential,commercial areas) are considered.
- Manual travelling by Schedulers.
- Large workforce required.
- Lengthy period of research.
- Benefits few compared to the effort required.

OUR PROPOSAL

- Predict number of buses required on each route based on ticket records.
- Dynamic Schedule generation every week or so.
- Reusable buses (ie. Buses not fixed to a single route).
- Schedules and allocation based records for each route in both direction

LITERATURE SURVEY

- Our prime focus has been to find out research papers that can be realized or cited in our solution.
- Literature survey has been mainly focused in the fields of:
 - ❑ Cluster Algorithms
 - ❑ Bus Scheduling algorithms
 - ❑ Optimal resource allocation
- Primary hurdle has been finding relevant research in alignment with our project objectives .
- Another aspect has been identifying the trade-offs between different attributes/features that can affect the creation of Dynamic Bus Schedules.
- Papers on data cleaning have been considered during the review.

CLUSTERING ALGORITHMS

- Prime focus has been on identifying suitable clustering algorithms that can be adapted for the given problem.
- Some of the important research papers surveyed in this regard are:
 - ❑ Modified K-means Clustering by Rudra Pratap Deb Nath, Hyunjo Lee, Nihad Karim Chowdhury, Jae-Woo Chang
 - ❑ Clustering And Aggregating Clues Of Trajectories For Mining Trajectory Patterns And Routes by Chih-Chieh Hung, Wen-Chih Peng, Wang-Chien Lee
- Most of the papers surveyed provide a base for identifying the useful clustering techniques to be used for the given problem.

BUS SCHEDULING ALGORITHMS

- Approaches considered within the survey vary widely from statistical methods to data mining models and linear programming.
- Some of the important research papers surveyed in this regard are:
 - ❑ Bus Scheduling Model: A Literature Review by Mohammad HesamHafezi, Amiruddin Ismail and Ramez A. Al-Mansob
 - ❑ Optimal Multi-vehicle Type Transit Timetabling And Vehicle Scheduling by Avishai (Avi) Ceder
- Our main focus in this survey was to identify methods suitable for our solution.

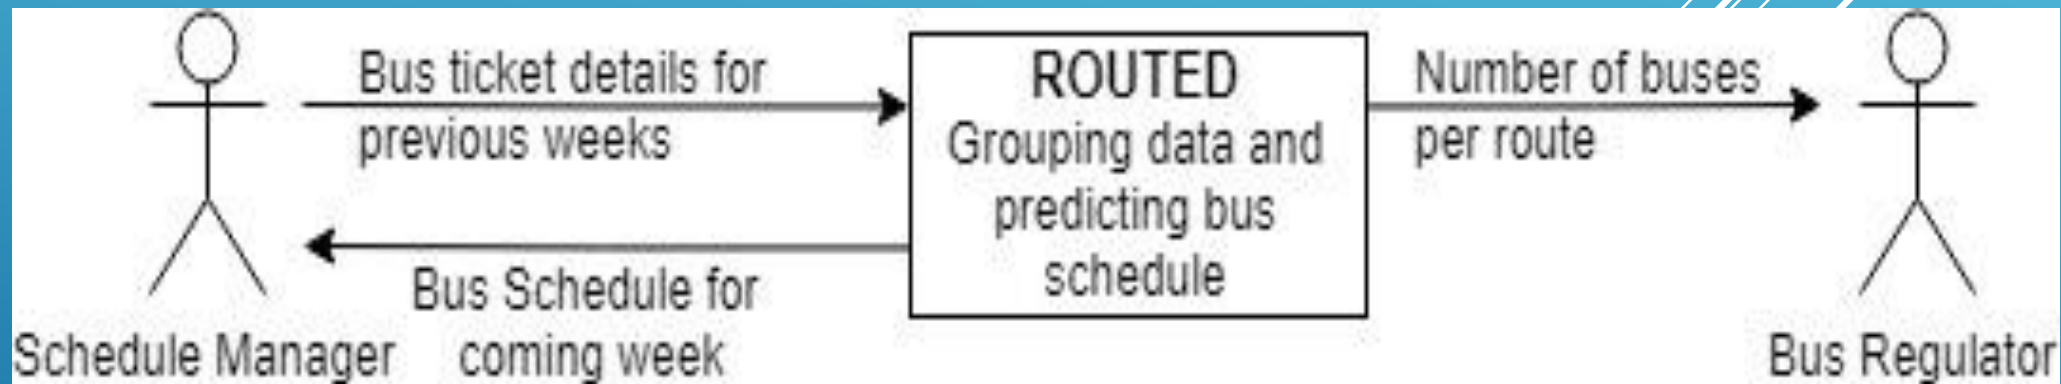

BUS ALLOCATION ALGORITHMS

- Primary aim has been to
 - ❑ Identify papers proposing mathematical models for Bus Allocation
 - ❑ Papers defining various angles to approach the problem of Bus Allocation
 - ❑ Papers focusing on the identification of different useful attributes/features in the data
- Some of the important research papers surveyed in this regard are:
 - ❑ Optimal Resource Allocation For Projects by Carbno Collin
 - ❑ The Allocation Of Buses In Heavily Utilized Networks With Overlapping Routes by Anthony F. Han and Nigel Wilson
- Our main focus in this survey was to understand different existing approaches.

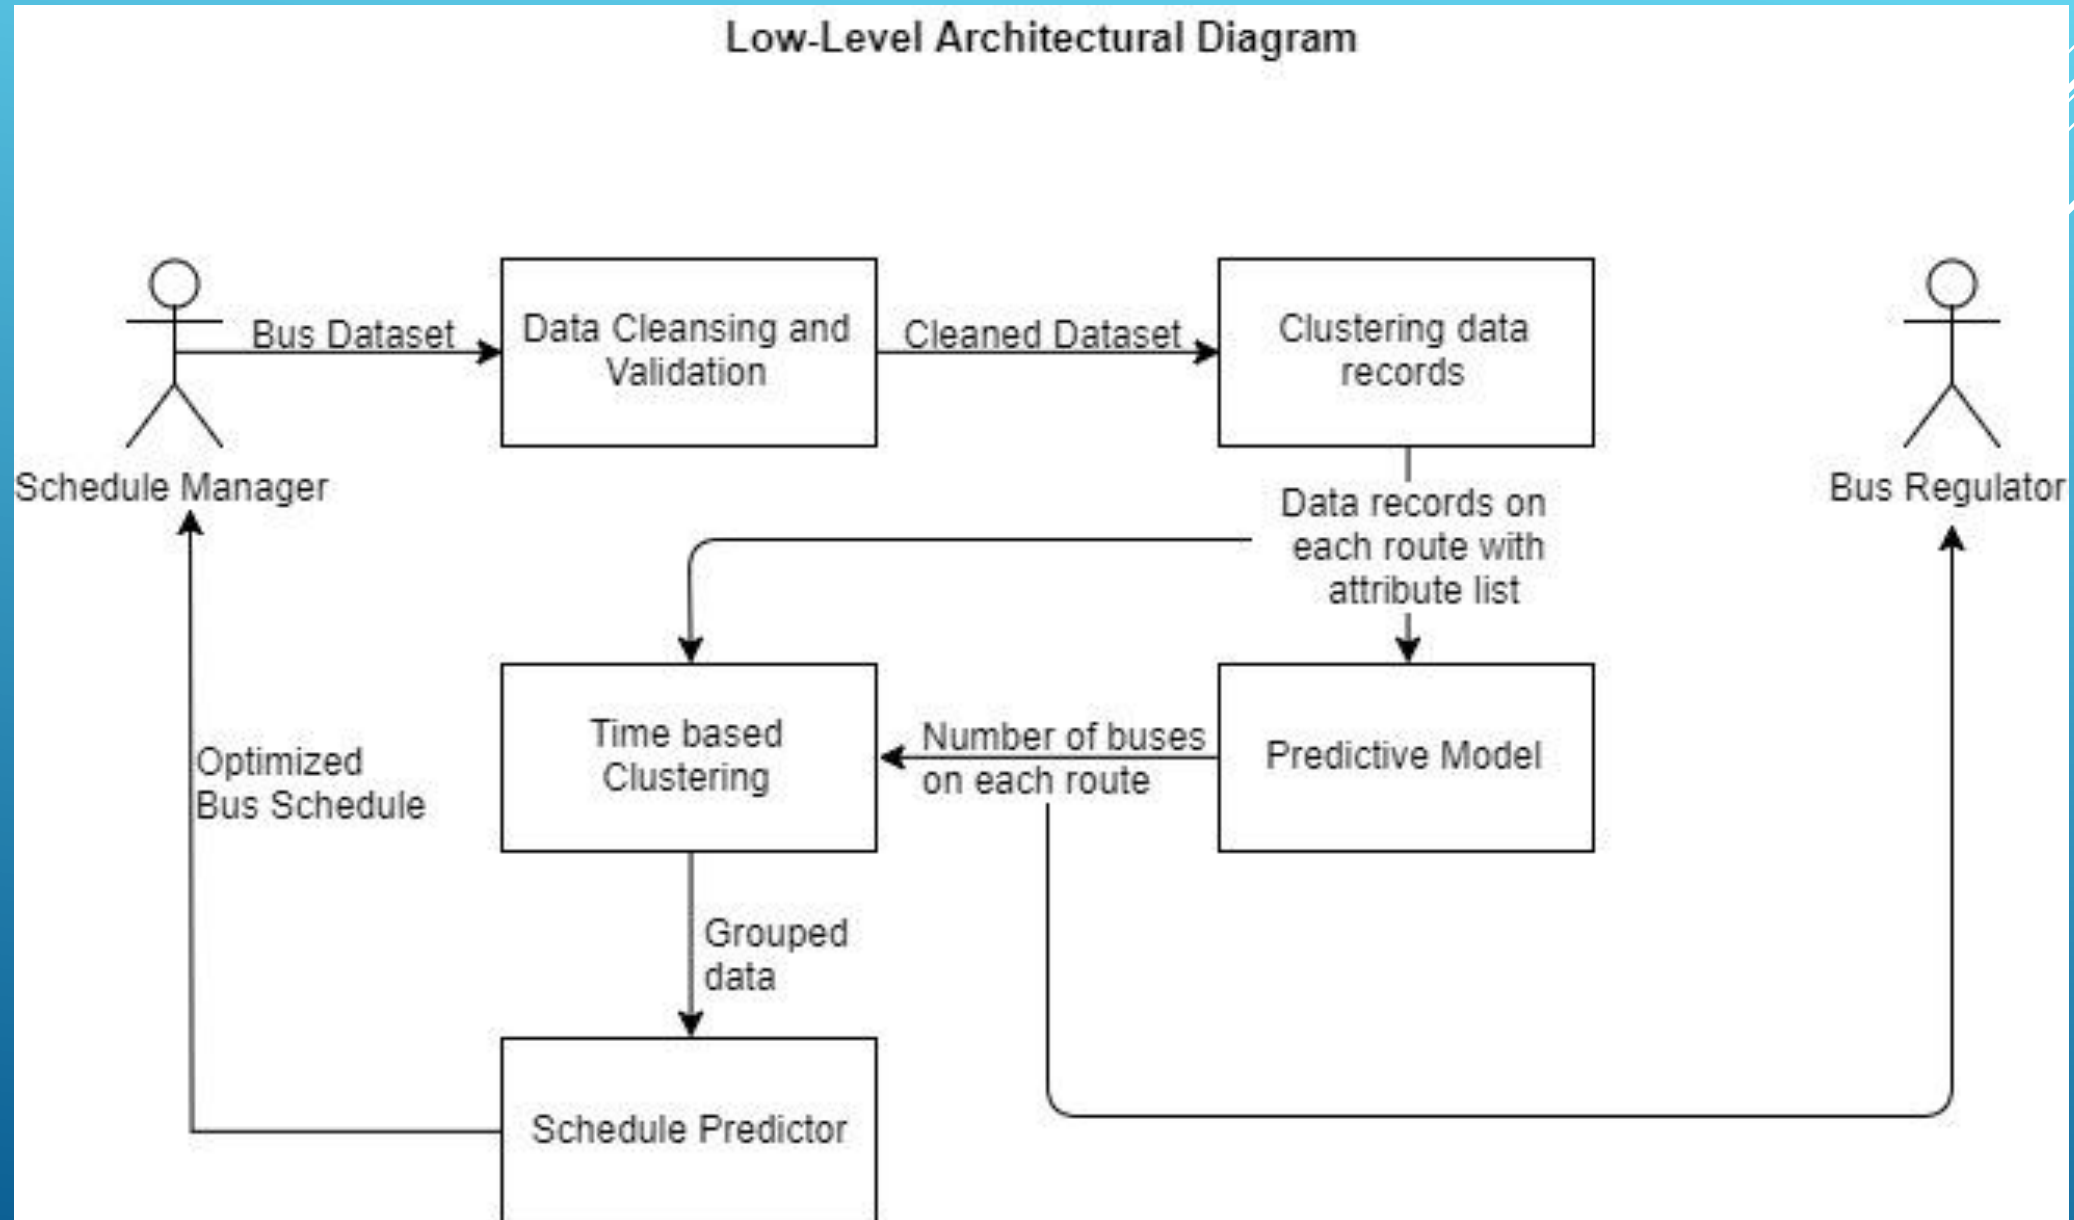

LITERATURE SURVEY OVERVIEW

- The literature available on the topics of our interest lack
 - ❑ Research papers that consider only ticket records for Bus scheduling and Allocation
 - ❑ Research papers that provide a complete model of Bus Scheduling and Allocation simultaneously
 - ❑ Clear distinction between the importance of different attributes that are used for clustering, scheduling and allocation
- As part of the review, we considered 18 research papers from relevant fields
- The research papers have been viewed as a guiding direction and not as a solution to be implemented and compared with the theoretical results
